

## PUI assignment 6A

### 1. Low fidelity prototype:

The shopping cart page should allow two functions, one is checkout, and another is editing the item. The details of the item should be editable. In order to save space, the different choices of the size and the glazing will be shown to the users in the form of drop-down lists.

### 2. High fidelity prototype:

The shopping cart page, just like previous pages, employs the blue color of the brand. In the cart, the users can clearly see the items they have added to their cart, including details such as the name, the image, the size, and the glazing. The items allow edits and changes such as delete the item as a whole, or edit quantity and glazing, in order to make the shopping experience more convenient.
